What's anomaly

> a person or thing that is different from what is usual, or not in agreement with something else and therefore not satisfactory [Cambridge Dictionary]

What's anomaly

- a person or thing that is different from what is usual, or not in agreement with something else and therefore not satisfactory [Cambridge Dictionary]
- a thing, situation, etc. that is different from what is normal or expected [Oxford Dictionary]

What's anomaly

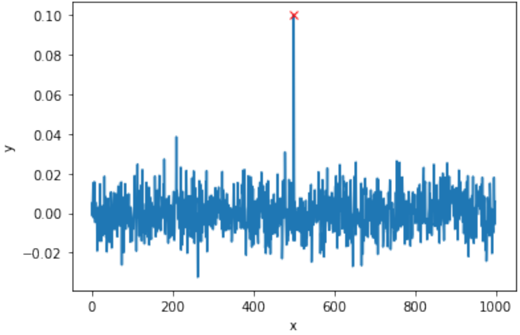
- a person or thing that is different from what is usual, or not in agreement with something else and therefore not satisfactory [Cambridge Dictionary]
- a thing, situation, etc. that is different from what is normal or expected [Oxford Dictionary]
- something different, abnormal, peculiar, or not easily classified [Merram-Webster]

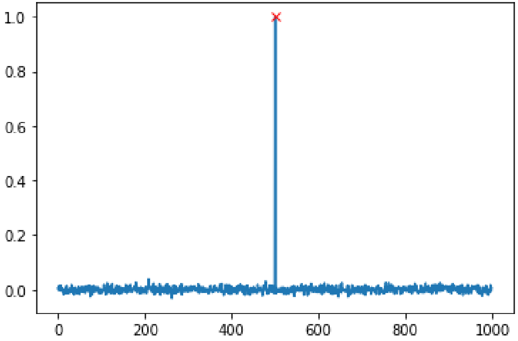
What's anomaly

- a person or thing that is different from what is usual, or not in agreement with something else and therefore not satisfactory [Cambridge Dictionary]
- a thing, situation, etc. that is different from what is normal or expected [Oxford Dictionary]
- something different, abnormal, peculiar, or not easily classified [Merram-Webster]
- …
- A person with no perceptible faults, who consistently fails at achieving matches thru all forms of social media [Urban Dictionary]

Point Anomaly

a single data sample that can be considered anomalous compared to the rest of the data [Wittkopp et al.(2022)Wittkopp, Wiesner, Scheinert, and Kao]





Point Anomaly - Cont'd

Point Anomaly - Cont'd

EUROPE ECONOMY

Euro zone inflation hits another record of 9.1% as food and energy prices soar

... Eurozone inflation hit a new record high in August of 9.1%, according to flash figures from Europe’s statistics office Eurostat, with high energy prices the main driving force. Werknghwrjhb werbn re4rhn. The rate was above expectations, with a Reuters poll of economists anticipating a rate of 9%... [Ward-Glenton(2022)]

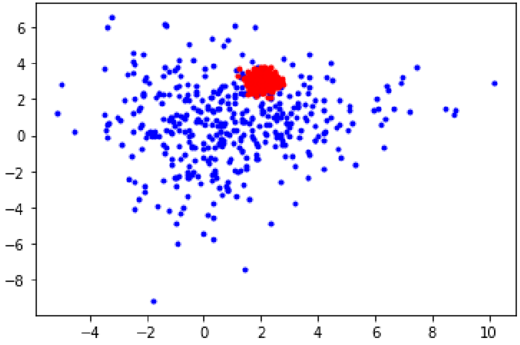
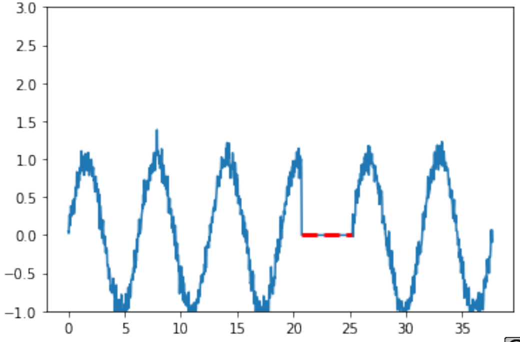
Group Anomaly

a multiple data samples that can be considered anomalous compared to the rest of the data

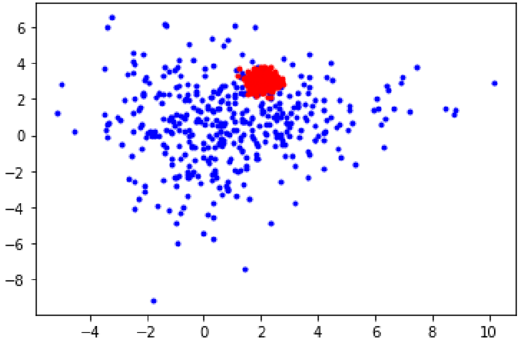


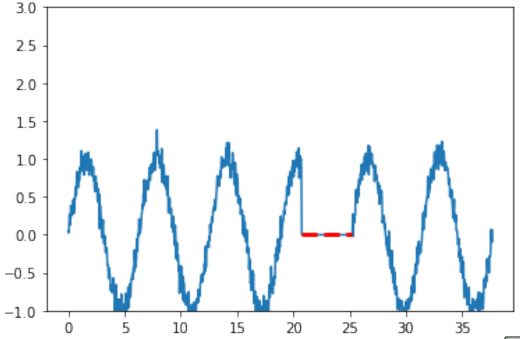


Group Anomaly

a multiple data samples that can be considered anomalous compared to the rest of the data

> individual samples are often not interesting,

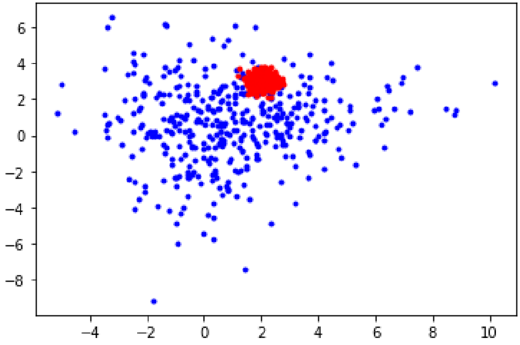


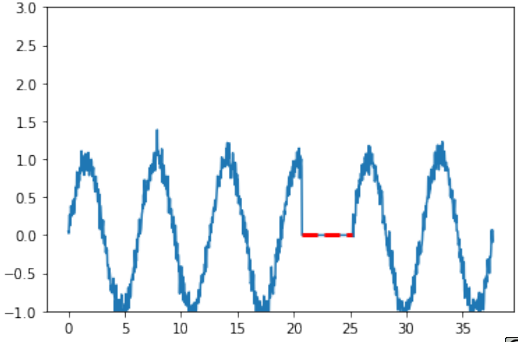


Group Anomaly

a multiple data samples that can be considered anomalous compared to the rest of the data

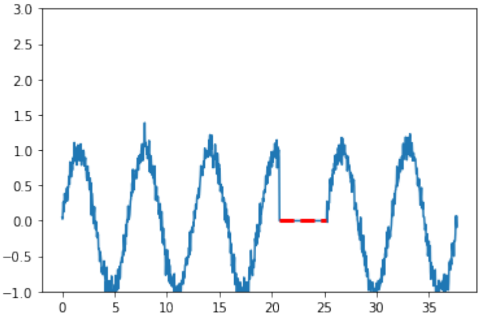
- individual samples are often not interesting,
- anomalous group of signals is an noticeably dense with respect to entire dataset.





Contextual Anomaly

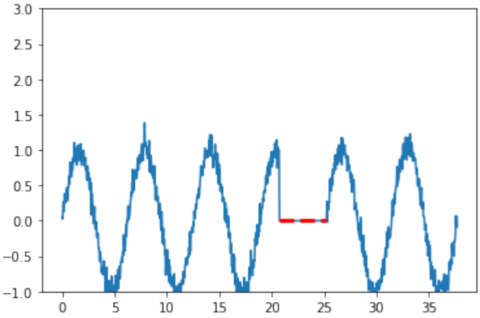
samples that are anomalous in a specific context only (but not otherwise) are called contextual anomalies[Wittkopp et al.(2022)Wittkopp, Wiesner, Scheinert, and Kao]



Contextual Anomaly

samples that are anomalous in a specific context only (but not otherwise) are called contextual anomalies[Wittkopp et al.(2022)Wittkopp, Wiesner, Scheinert, and Kao]

- can have the same feature-set (behavioral properties) as normal samples,



Contextual Anomaly

samples that are anomalous in a specific context only (but not otherwise) are called contextual anomalies[Wittkopp et al.(2022)Wittkopp, Wiesner, Scheinert, and Kao]

- can have the same feature-set (behavioral properties) as normal samples,
- but are still anomalous within a specific context defined by their contextual properties.

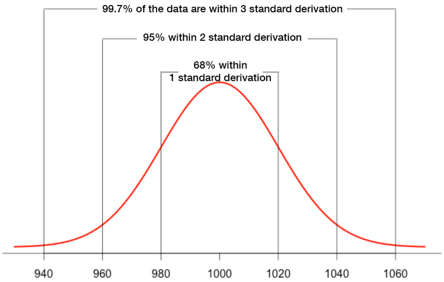
Anomaly Detection - Basics - 3-Sigma Rule

- Mean μ defines an average value ($\mu = 1000$).

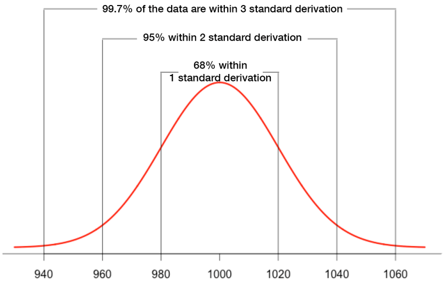


[Magakian(2018)]

See https://github.com/sulcantonin/MLE2022/blob/main/MLE_Basics.ipynb

Anomaly Detection - Basics - 3-Sigma Rule

- Mean μ defines an average value ($\mu = 1000$).
- Standard deviation σ, defines how far the normal distribution is spread around the mean ($\sigma = 20$).

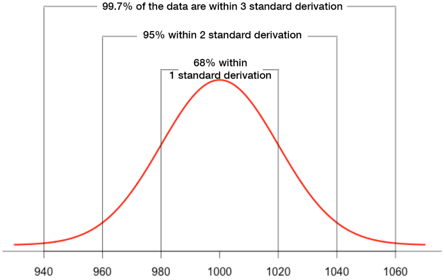


[Magakian(2018)]

See https://github.com/sulcantonin/MLE2022/blob/main/MLE_Basics.ipynb

Anomaly Detection - Basics - 3-Sigma Rule

- Mean μ defines an average value ($\mu = 1000$).
- Standard deviation σ, defines how far the normal distribution is spread around the mean ($\sigma = 20$).
- 68% of all values fall between $[\mu - \sigma, \mu + \sigma]$, i.e. [980, 1020].

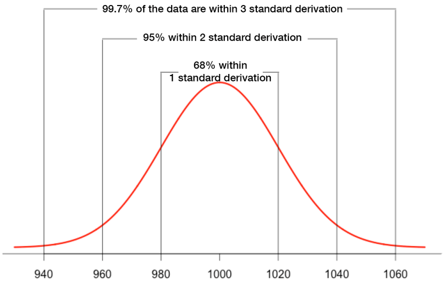


[Magakian(2018)]

See https://github.com/sulcantonin/MLE2022/blob/main/MLE_Basics.ipynb

Anomaly Detection - Basics - 3-Sigma Rule

> Mean μ defines an average value ($\mu = 1000$).
> Standard deviation σ, defines how far the normal distribution is spread around the mean ($\sigma = 20$).
> 68% of all values fall between $[\mu - \sigma, \mu + \sigma]$, i.e. [980, 1020].
> 95% of all values fall between $[\mu - 2\sigma, \mu + 2\sigma]$, i.e. [960, 1040].

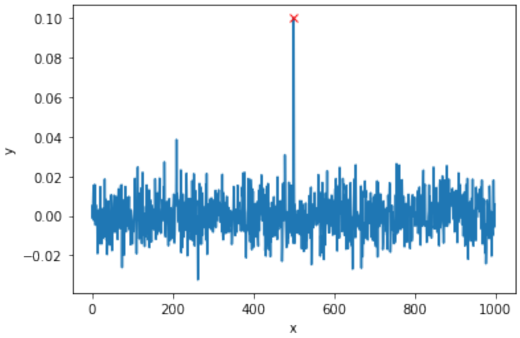


[Magakian(2018)]

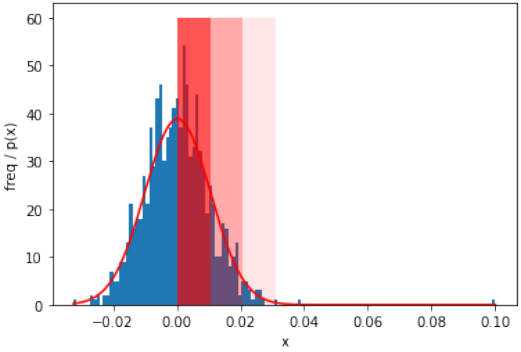
See https://github.com/sulcantonin/MLE2022/blob/main/MLE_Basics.ipynb

Anomaly Detection - 3-Sigma Example

Plot



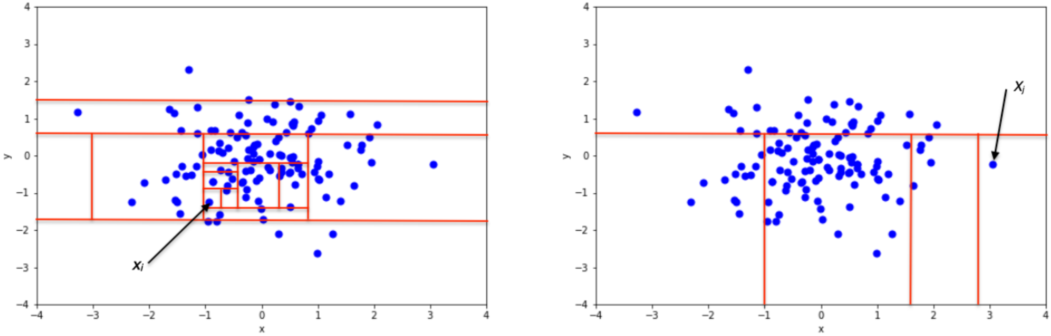
Histogram



See https://github.com/sulcantonin/MLE2022/blob/main/MLE_Basics.ipynb

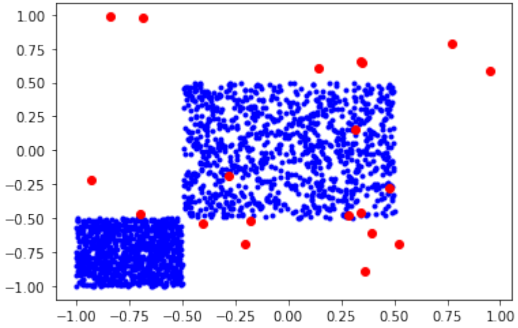
Anomaly Detection - Isolation Forest

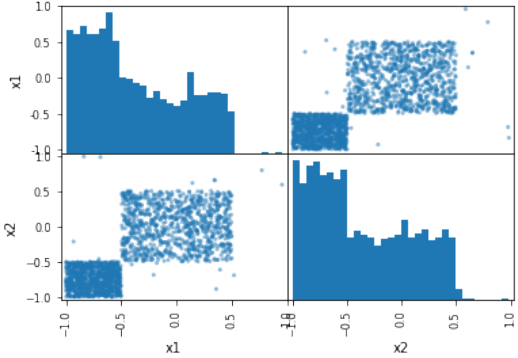
Isolation forest split the data space using lines that are orthogonal to the origin, and assigns higher anomaly scores to data points that need few splits to be isolated. [wik(2022)]



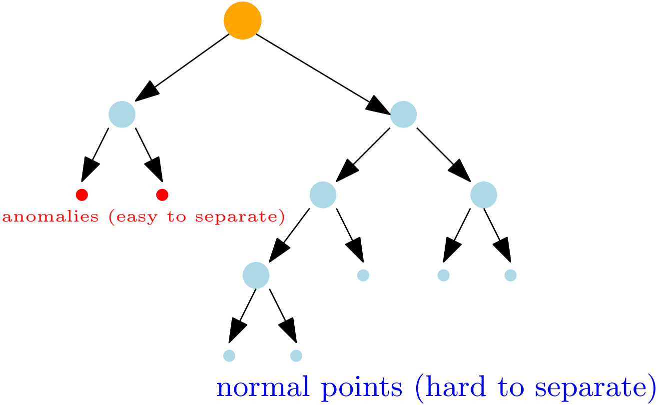
Anomaly Detection - Isolation Forest

What if the points are not normally distributed?

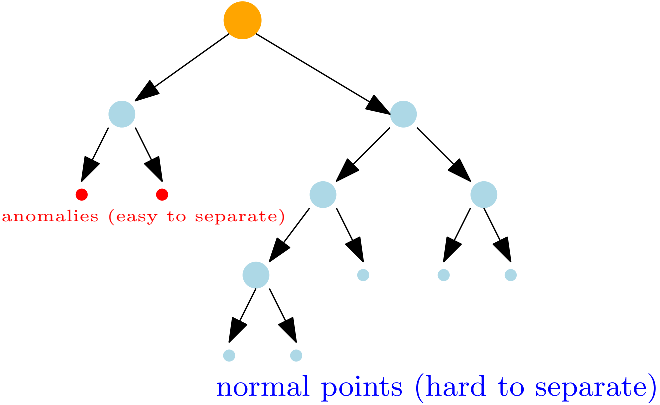


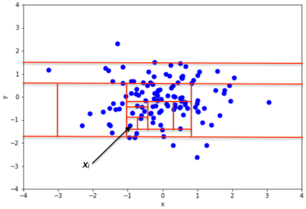


Anomaly Detection - Isolation Forest

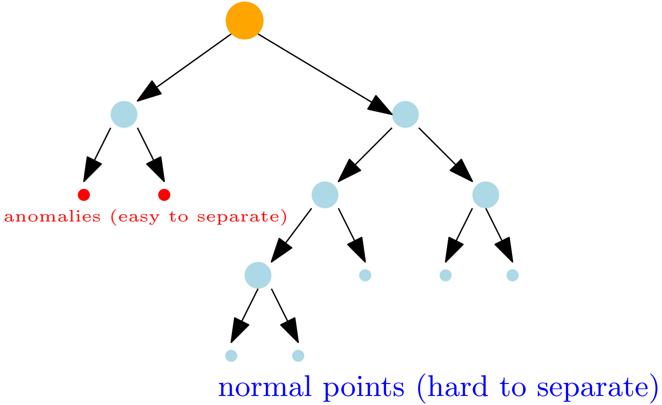


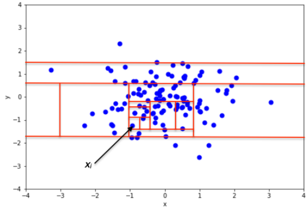
Anomaly Detection - Isolation Forest

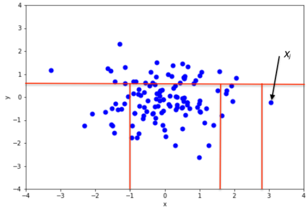




Anomaly Detection - Isolation Forest





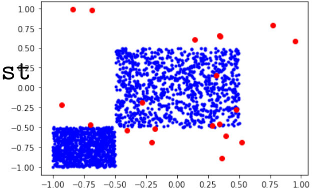


Anomaly Detection - Isolation Forest Example

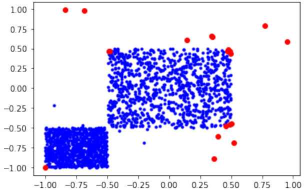
```
from sklearn.ensemble import IsolationForest
import numpy.random as r
r.seed(42)
Xn1 = r.rand(1000,2) - 0.5
Xn2 = (r.rand(1000,2) - 2) * 0.5
Xn = np.concatenate((Xn1,Xn2))
Xa = 2 * (r.rand(20,2) - 0.5)
X = np.concatenate((Xn,Xa))

cont= 20.0 / 2020.0 # ratio of anomalies
if = IsolationForest(contamination = cont, random_state = 42)
l = if.fit_predict(X)
```

Generated Samples



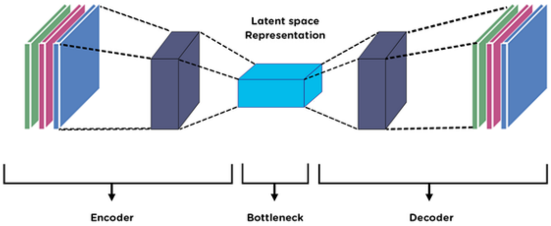
Results (Isolation Forest)



Anomaly Detection - Auto-encoder

What if we have data and want to train a model of a set of data points $\{x_1 \ldots x_N\}$?

$\mathbf{x}$ $\quad$ $\mathbf{z} = enc(\mathbf{x})$ $\quad$ $\hat{\mathbf{x}} = dec(\mathbf{z})$



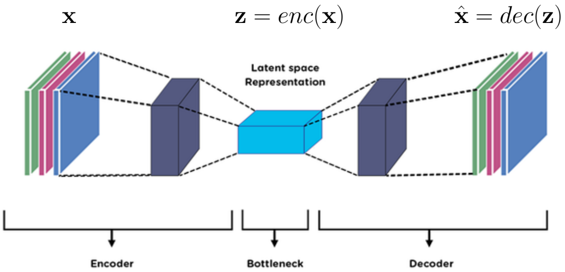
[Birla(2019)]

$$s = \|\mathbf{x} - dec(enc(\mathbf{x}))\|_2$$

See https://github.com/sulcantonin/MLE2022/blob/main/MLE_Autoenc.ipynb

Anomaly Detection - Auto-encoder

What if we have data and want to train a model of a set of data points $\{x_1 \ldots x_N\}$?



[Birla(2019)]

$$s = \|\mathbf{x} - dec(enc(\mathbf{x}))\|_2$$

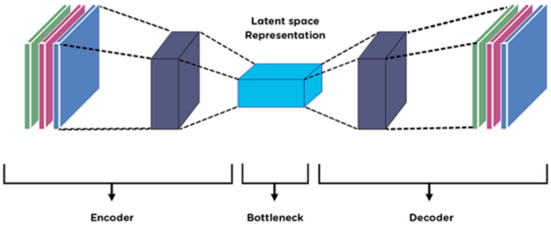
+/- Trains the network "generatively".

See https://github.com/sulcantonin/MLE2022/blob/main/MLE_Autoenc.ipynb

Anomaly Detection - Auto-encoder

What if we have data and want to train a model of a set of data points $\{x_1 \dots x_N\}$?

$\mathbf{x}$ $\quad\quad$ $\mathbf{z} = enc(\mathbf{x})$ $\quad\quad$ $\hat{\mathbf{x}} = dec(\mathbf{z})$



[Birla(2019)]

$$s = \|\mathbf{x} - dec(enc(\mathbf{x}))\|_2$$

+/- Trains the network ”generatively”.

- Technically you are not training anomaly detection, but training a model of data

See https://github.com/sulcantonin/MLE2022/blob/main/MLE_Autoenc.ipynb

Anomaly Detection - Auto-encoder Example

```
enc = nn.Sequential(
    nn.Linear(2, 8),
    nn.ReLU(),
    nn.Linear(8, 16))
dec = nn.Sequential(
    nn.Linear(16, 8),
    nn.ReLU(),
    nn.Linear(8, 2))
def score_reconstruction(x):
    return vector_norm(dec(enc(x)) - x, dim=-1)
```

Reconstr. loss - score

$$\downarrow \|\mathbf{x} - dec(enc(\mathbf{x}))\|_2$$

See https://github.com/sulcantonin/MLE2022/blob/main/MLE_Autoenc.ipynb

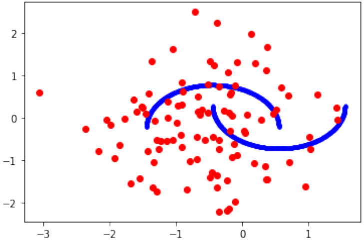
Anomaly Detection - Auto-encoder Example Cont'd

```
optimizer = optim.Adam( list(enc.parameters()) +
                        list(dec.parameters()))
# reconstruction (X_hat)
X_hat = model(X)
# criterion ||X - X_hat||_2
loss = F.mse_loss(X_hat, X)
optimizer.zero_grad()
loss.backward()
optimizer.step()
```

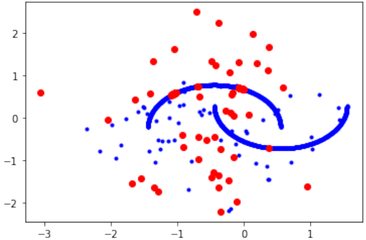
See https://github.com/sulcanton-in/MLE2022/blob/main/MLE_Autoenc.ipynbg

Anomaly Detection - Auto-encoder Example Cont'd

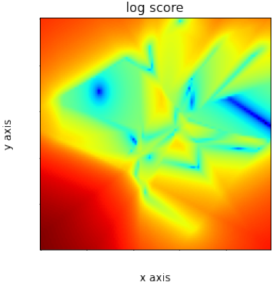
Input Points



Trained Classification



$$s = \|\mathbf{x} - dec(enc(\mathbf{x}))\|_2$$

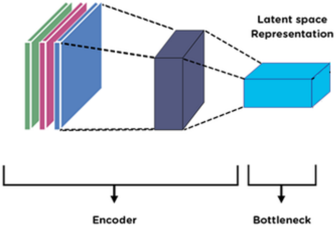


See https://github.com/sulcantonin/MLE2022/blob/main/MLE_Autoenc.ipynb

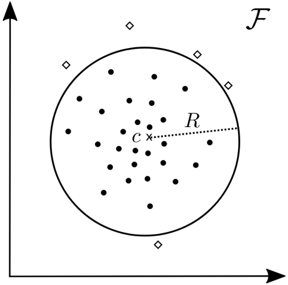
Anomaly Detection - One Class Loss (OCL)

What if we have data and want to train a model of a set of data points $\{x_1 \ldots x_N\}$?

$\mathbf{x}$ $\qquad$ $\mathbf{z} = enc(\mathbf{x})$



$$
\begin{aligned}
s &= \|enc(\mathbf{x}) - \mathbf{c}\|_2 \\
&= \|\mathbf{z} - \mathbf{c}\|_2
\end{aligned}
$$



$$s = \|enc(\mathbf{x}) - \mathbf{c}\|_2$$

Networks trains to project **x** to fit the hyphersphere center **c**

[Ruff(2019)]

+ Trains the network ”discriminatively”,
- One has to be careful with trivial solutions

  i. e. $\mathbf{c} \neq 0$, no biases and unbounded non-linearity

See https://github.com/sulcantonin/MLE2022/blob/main/MLE_OCL.ipynb

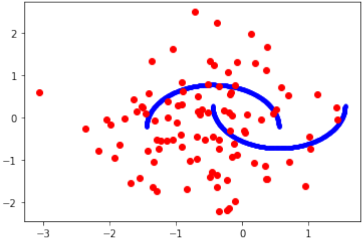
Anomaly Detection - One Class Loss

```
enc = nn.Sequential(nn.Linear(2,8, bias = False),
    nn.Linear(8,16, bias = False),
    nn.Linear(16,4, bias = False))
# random center of 4D hypersphere
c = torch.randn((1,4), requires_grad = False)
optimizer = optim.Adam(enc.parameters())
# reconstruction (X_hat)
X_hat = enc(X)
loss = vector_norm(X_hat - c, dim = -1).mean()
# Optimisation enc s.t. min ||c - enc(X_hat)||_2
optimizer.zero_grad()
loss.backward()
optimizer.step()
```

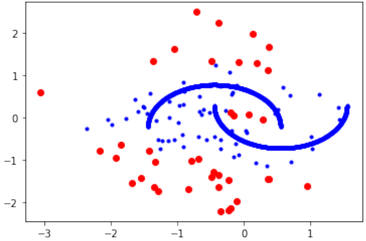
See https://github.com/sulcantonin/MLE2022/blob/main/MLE_OCL.ipynb

Anomaly Detection - One Class Loss Example Cont'd

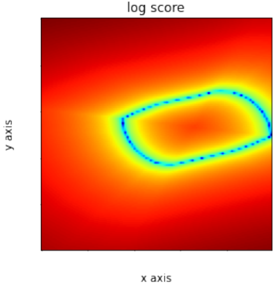
Input Points



Trained Classification



$s = \|\mathbf{c} - enc(\mathbf{x})\|_2$



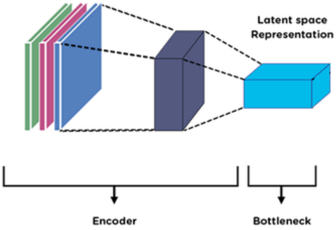
See https://github.com/sulcantonin/MLE2022/blob/main/MLE_OCL.ipynb

Anomaly Detection - Semi-Supervised

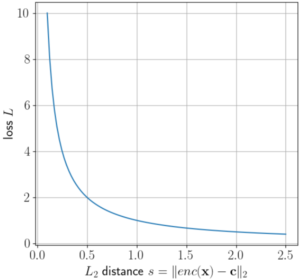
What if we have data and want to train a model of a set of data points $\{x_1 \dots x_N\}$ with very few **known** anomalies?

Anomaly $\rightarrow \|enc(\mathbf{x}) - \mathbf{c}\|^{-1}$

$\mathbf{x}$ $\quad$ $\mathbf{z} = enc(\mathbf{x})$



$$\begin{aligned} s &= \|enc(\mathbf{x}) - \mathbf{c}\|_2 \\ &= \|\mathbf{z} - \mathbf{c}\|_2 \end{aligned}$$



$$s = \|enc(\mathbf{x}) - \mathbf{c}\|^l \text{ where } l \in \{-1, 1\}$$

Known anomalies ($l = -1$) encourage enc and $\mathbf{c}$ to move away.

See https://github.com/sulcantonin/MLE2022/blob/main/MLE_SAD.ipynb

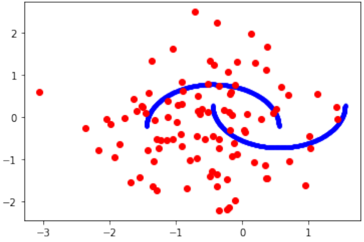
Anomaly Detection - Semi-Supervised Example

```
enc = nn.Sequential(nn.Linear(2,8),
    nn.Linear(8,16),
    nn.Linear(16,4))
# random center of 4D hypersphere
enc.c = nn.Parameter(torch.randn((1,4), requires_grad = True))
optimizer = optim.Adam(enc.parameters())
# reconstruction (X_hat)
X_hat = enc(X)
loss = vector_norm((X_hat - c)**1, dim = -1).mean()
# Optimisation enc s.t. min ||c - enc(X_hat)||_2
optimizer.zero_grad()
loss.backward()
optimizer.step()
```

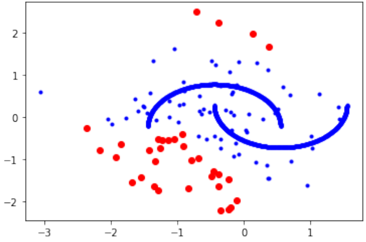
See https://github.com/sulcantonin/MLE2022/blob/main/MLE_SAD.ipynb

Anomaly Detection - Semi-supervised Example Cont'd

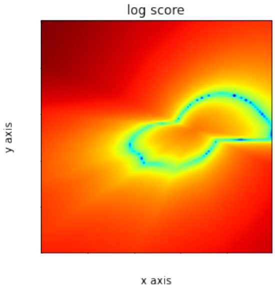
Input Points



Trained Classification

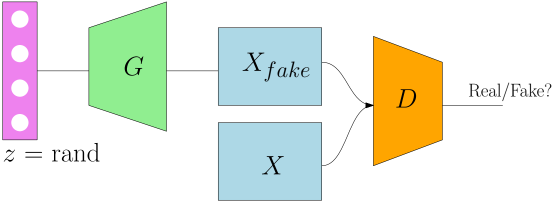


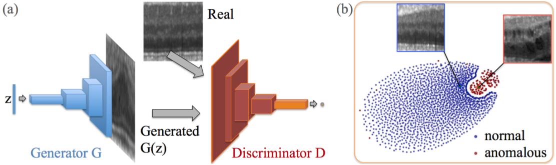
$s = \|\mathbf{c} - enc(\mathbf{x})\|_2$



See https://github.com/sulcantonin/MLE2022/blob/main/MLE_SAD.ipynb

Anomaly Detection - Generative Adversarial Networks





- > G generates fake samples and tries to fool discriminator D.
- > D receives fake and real samples and tries to distinguish if an input is fake or real.

[Goodfellow et al.(2020)Goodfellow, Pouget-Abadie, Mirza, Xu, Warde-Farley, Ozair, Courville, and Bengio, Wiggers(2019),

Schlegl et al.(2017)Schlegl, Seeböck, Waldstein, Schmidt-Erfurth, and Langs]

$$\arg\min_{z_\gamma}\{(1-\lambda)\|x - G(z_\gamma)\| + \lambda CrossEntropyLoss\left(D\left(G\left(z_\gamma\right)\right), 1\right)\}$$

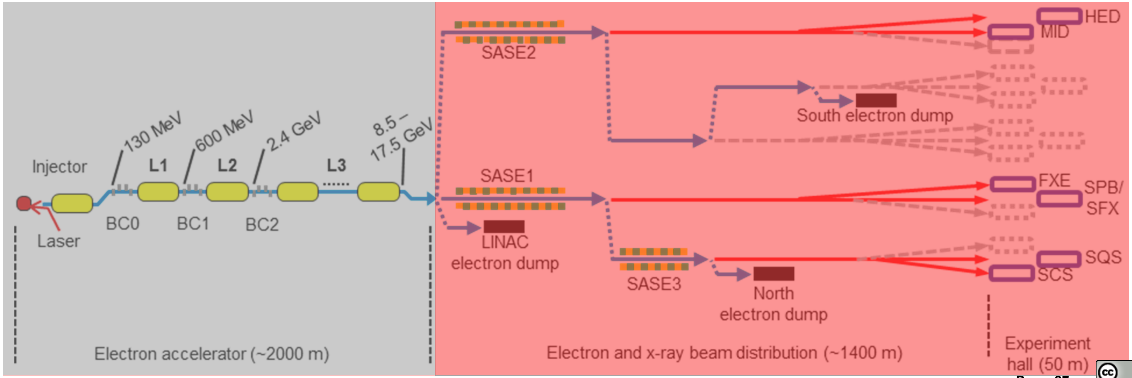
See https://github.com/sulcantonin/MLE2022/blob/main/MLE_GAN.ipynb

Anomaly Detection at European XFEL

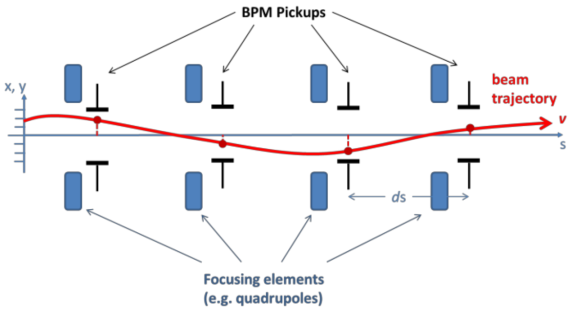
Orbit Monitoring

Assumption

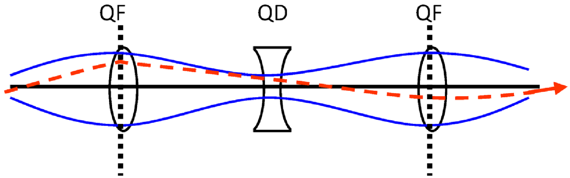
There is a systematic pattern shown in orbits given by the physical construction of EuXFEL.



Orbit Monitoring - FODO Lattice



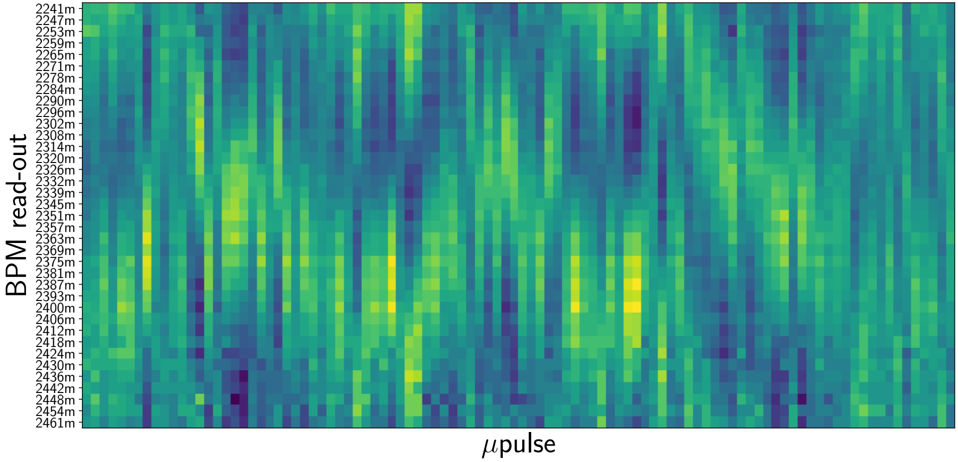
[Wendt(2011)]



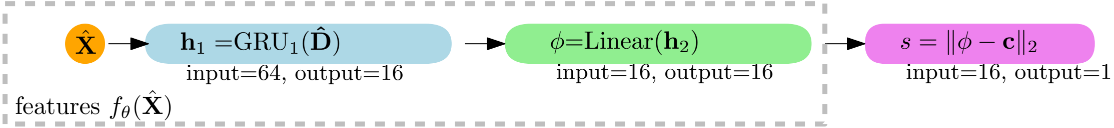
[Holzer(2006)]

Orbit Monitoring

Orbit Monitoring



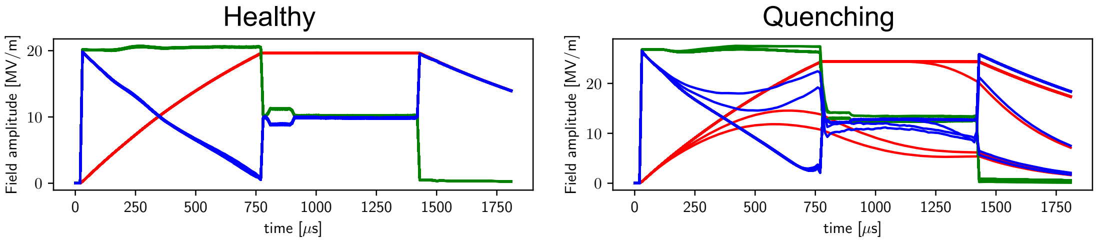
Orbit Monitoring



```
rnn = nn.GRU(64,16)
lin = nn.Linear(16,16)
c = nn.randn((16))
s = vector_rnom(c - lin(rnn(x)[0], dim = -1)
```

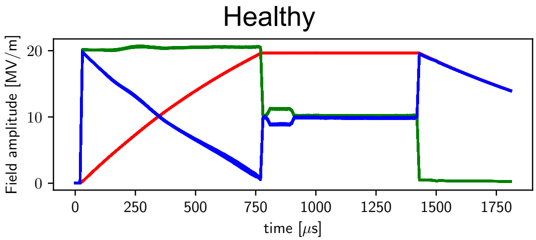
See https://github.com/sulcantonin/MLE2022/blob/main/MLE_orbit.ipynb

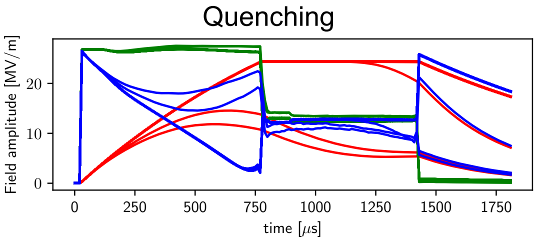
Monitoring Superconducting LLRF Cavities



- We record an envelope (phase, amplitude) of three signals - probe, forward and reflected signals.

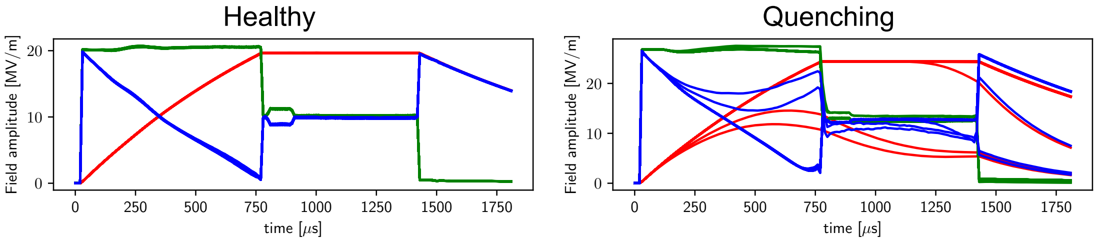
Monitoring Superconducting LLRF Cavities





- We record an envelope (phase, amplitude) of three signals - probe, forward and reflected signals.
- Each signal consists of a pair of 1820 values (amplitude, phase) per pulse.

Monitoring Superconducting LLRF Cavities



- We record an envelope (phase, amplitude) of three signals - probe, forward and reflected signals.
- Each signal consists of a pair of 1820 values (amplitude, phase) per pulse.
- Quench (right) means a loss of superconductivity in a cavity, which has a significant effect on the quality factor.

Data-Driven Monitoring of Superconducting LLRF Cavities

$$\underbrace{\underset{\text{input=1092, output=256}}{\mathbf{h}_1=\mathrm{LSTM}(\mathbf{x})} \longrightarrow \underset{\text{input=256, output=256}}{\mathbf{h}_2=\mathrm{LSTM}(\mathbf{h}_1)} \longrightarrow \underset{\text{input=256, output=64}}{\phi=\mathrm{Linear}(\mathbf{h}_2)}}_{f_\theta(\mathbf{x})} \longrightarrow \underset{\text{input=64, output=1}}{s=\|\phi\left(\mathbf{h}_2\right)-\mathbf{c}\|_2^2} \longrightarrow$$

> A RNN is assigning a score to series of cavity pulses.

See https://github.com/sulcantonin/MLE2022/blob/main/MLE_cavity.ipynb

Data-Driven Monitoring of Superconducting LLRF Cavities

$$\underbrace{\underset{\text{input=1092, output=256}}{\mathbf{h}_1 = \mathrm{LSTM}(\mathbf{x})} \rightarrow \underset{\text{input=256, output=256}}{\mathbf{h}_2 = \mathrm{LSTM}(\mathbf{h}_1)} \rightarrow \underset{\text{input=256, output=64}}{\phi = \mathrm{Linear}(\mathbf{h}_2)}}_{f_\theta(\mathbf{x})} \rightarrow \underset{\text{input=64, output=1}}{s = \|\phi(\mathbf{h}_2) - \mathbf{c}\|_2^2} \rightarrow$$

- A RNN is assigning a score to series of cavity pulses.
- Each datum **x** (pulse) consist of (probe, forward and reflected signals).

See https://github.com/sulcantonin/MLE2022/blob/main/MLE_cavity.ipynb

Data-Driven Monitoring of Superconducting LLRF Cavities

$$\underbrace{\underset{\text{input=1092, output=256}}{\mathbf{h}_1\text{=LSTM}(\mathbf{x})} \longrightarrow \underset{\text{input=256, output=256}}{\mathbf{h}_2\text{=LSTM}(\mathbf{h}_1)} \longrightarrow \underset{\text{input=256, output=64}}{\phi\text{=Linear}(\mathbf{h}_2)}}_{f_\theta(\mathbf{x})} \longrightarrow \underset{\text{input=64, output=1}}{s = \|\phi(\mathbf{h}_2) - \mathbf{c}\|_2^2} \longrightarrow$$

- A RNN is assigning a score to series of cavity pulses.
- Each datum **x** (pulse) consist of (probe, forward and reflected signals).
- We have a disproportionately smaller dataset with faults (1300 faults) and (almost) unlimited access to healthy data.

See https://github.com/sulcantonin/MLE2022/blob/main/MLE_cavity.ipynb

Data-Driven Monitoring of Superconducting LLRF Cavities

$$\underbrace{\underset{\text{input=1092, output=256}}{\mathbf{h}_1 = \mathrm{LSTM}(\mathbf{x})} \rightarrow \underset{\text{input=256, output=256}}{\mathbf{h}_2 = \mathrm{LSTM}(\mathbf{h}_1)} \rightarrow \underset{\text{input=256, output=64}}{\phi = \mathrm{Linear}(\mathbf{h}_2)}}_{f_\theta(\mathbf{x})} \rightarrow \underset{\text{input=64, output=1}}{s = \|\phi(\mathbf{h}_2) - \mathbf{c}\|_2^2} \rightarrow$$

- A RNN is assigning a score to series of cavity pulses.
- Each datum **x** (pulse) consist of (probe, forward and reflected signals).
- We have a disproportionately smaller dataset with faults (1300 faults) and (almost) unlimited access to healthy data.
- Semi-supervised anomaly loss [Ruff(2019)]

$$L(\theta) = \|f_\theta(\mathbf{x}) - \mathbf{c}\|_2^y + \|f_\theta(\mathbf{x}) - \mathbf{c}\|_2 \text{ where } y \in \{-1, 1\}.$$

See https://github.com/sulcantonin/MLE2022/blob/main/MLE_cavity.ipynb
