Training and Detection of Anomalies at European XFEL

Antonin Sulc Hamburg, September 12, 2022

CDCS

a person or thing that is different from what is usual, or not in agreement with something else and therefore not satisfactory [Cambridge Dictionary]

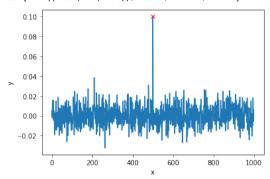

- > a person or thing that is different from what is usual, or not in agreement with something else and therefore not satisfactory [Cambridge Dictionary]
- > a thing, situation, etc. that is different from what is normal or expected [Oxford Dictionary]

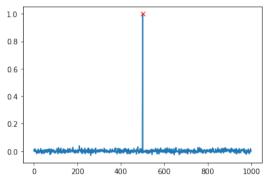

- a person or thing that is different from what is usual, or not in agreement with something else and therefore not satisfactory [Cambridge Dictionary]
- a thing, situation, etc. that is different from what is normal or expected [Oxford Dictionary]
- > something different, abnormal, peculiar, or not easily classified [Merram-Webster]

- > a person or thing that is different from what is usual, or not in agreement with something else and therefore not satisfactory [Cambridge Dictionary]
- a thing, situation, etc. that is different from what is normal or expected [Oxford Dictionary]
- > something different, abnormal, peculiar, or not easily classified [Merram-Webster]
- >
- > A person with no perceptible faults, who consistently fails at achieving matches thru all forms of social media [Urban Dictionary]

Point Anomaly

a single data sample that can be considered anomalous compared to the rest of the data [Wittkopp et al.(2022)Wittkopp, Wiesner, Scheinert, and Kao]

Point Anomaly - Cont'd

Euro zone inflation hits another record of 9.1% as food and energy prices soar

Point Anomaly - Cont'd

EUROPE ECONOMY

Euro zone inflation hits another record of 9.1% as food and energy prices soar

... Eurozone inflation hit a new record high in August of 9.1%, according to flash figures from Europe's statistics office Eurostat, with high energy prices the main driving force. Werknghwrjhb werbn re4rhn. The rate was above expectations, with a Reuters poll of economists anticipating a rate of 9%... [Ward-Glenton(2022)]

Point Anomaly - Cont'd

Group Anomaly

a multiple data samples that can be considered anomalous compared to the rest of the data

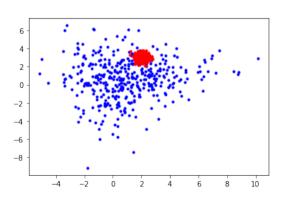

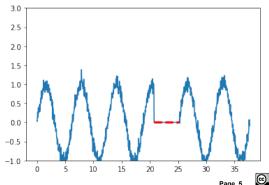

Group Anomaly

a multiple data samples that can be considered anomalous compared to the rest of the data

> individual samples are often not interesting,

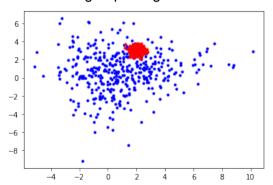

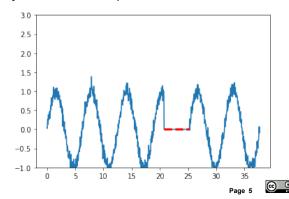

Group Anomaly

a multiple data samples that can be considered anomalous compared to the rest of the data

- > individual samples are often not interesting,
- anomalous group of signals is an noticeably dense with respect to entire dataset.

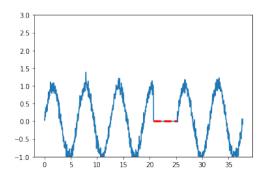

Contextual Anomaly

samples that are anomalous in a specific context only (but not otherwise) are called contextual anomalies [Wittkopp et al. (2022) Wittkopp, Wiesner, Scheinert, and Kaol

- can have the same feature-set (behavioral properties) as normal samples.
- but are still anomalous within a specific context defined by their contextual properties.

Contextual Anomaly - Cont'd

Euro zone inflation hits another record of 9.1% as food and energy prices soar

Contextual Anomaly - Cont'd

Euro zone inflation hits another record of 9.1% as food and energy prices soar

Anomaly Detection - Basics - 3-Sigma Rule

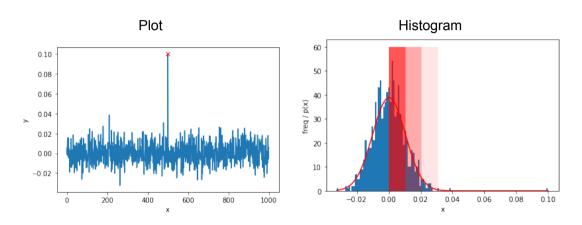

- > Mean μ defines an average value ($\mu = 1000$).
- > Standard deviation σ , defines how far the normal distribution is spread around the mean ($\sigma = 20$).
- > 68% of all values fall between $[\mu \sigma, \mu + \sigma]$, i.e. [980, 1020].
- > 95% of all values fall between $[\mu-2\sigma,\mu+2\sigma]$, i.e. [960, 1040].

[Magakian(2018)]

See https://github.com/sulcantonin/MLE-2022/blob/main/MLE_Basics.ipynb

Anomaly Detection - 3-Sigma Example

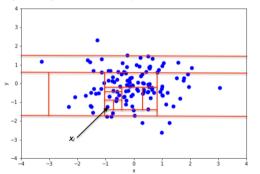

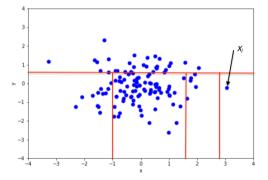

See https://github.com/sulcantonin/MLE-2022/blob/main/MLE_Basics.ipynb

Anomaly Detection - Isolation Forest

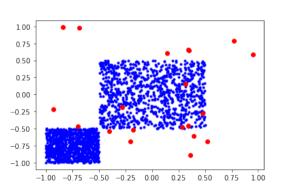

Isolation forest split the data space using lines that are orthogonal to the origin, and assigns higher anomaly scores to data points that need few splits to be isolated. [wik(2022)]

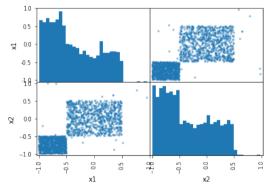

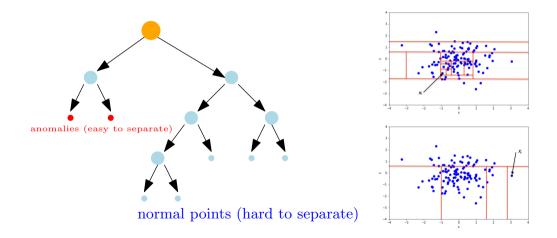

Anomaly Detection - Isolation Forest

What if the points are not normally distributed?

Anomaly Detection - Isolation Forest

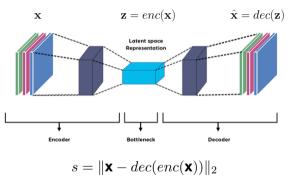

Anomaly Detection - Isolation Forest ExampleGenerated Samples

```
from sklearn.ensemble import IsolationForest
import numpy.random as r
                                               -0.25
r.seed(42)
Xn1 = r.rand(1000,2) - 0.5
                                                   Results (Isolation Forest)
Xn2 = (r.rand(1000.2) - 2) * 0.5
Xn = np.concatenate((Xn1,Xn2))
                                               0.50
Xa = 2 * (r.rand(20,2) - 0.5)
X = np.concatenate((Xn,Xa))
                                               -0.25
cont= 20.0 / 2020.0 # ratio of anomalies
if = IsolationForest(contamination = cont, random state = 42)
l = if.fit predict(X)
```

Anomaly Detection - Auto-encoder

What if we have data and want to train a model of a set of data points $\{x_1 \dots x_N\}$?

+/- Trains the network "generatively".

[Birla(2019)]

- Technically you are not training anomaly detection, but training a model of data See https://github.com/sulcantonin/MLE-2022/blob/main/MLE_Autoenc.ipynb

Anomaly Detection - Auto-encoder Example

```
enc = nn.Sequential(
    nn.Linear(2, 8),
    nn.ReLU().
    nn.Linear(8, 16))
dec = nn.Sequential(
    nn.Linear(16, 8).
    nn.ReLU(),
                                  Reconstr. loss - score
    nn.Linear(8, 2))
                                        \downarrow \|\mathbf{x} - dec(enc(\mathbf{x}))\|_2
def score reconstruction(x):
    return vector norm(dec(enc(x)) - x, dim=-1)
```

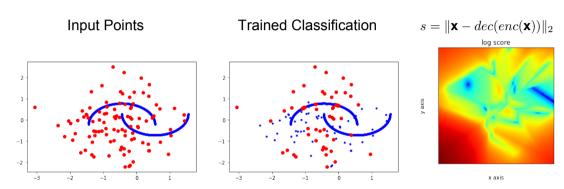

See https://github.com/sulcantonin/MLE-2022/blob/main/MLE_Autoenc.ipynb

Anomaly Detection - Auto-encoder Example Cont'd

See https://github.com/sulcantonin/MLE-2022/blob/main/MLE_Autoenc.ipynbg

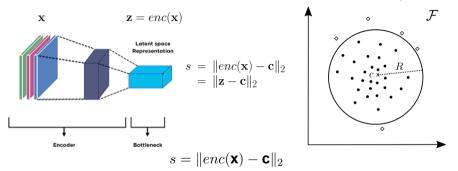

Anomaly Detection - Auto-encoder Example Cont'd

See https://github.com/sulcantonin/MLE-2022/blob/main/MLE_Autoenc.ipynb

Anomaly Detection - One Class Loss (OCL)

What if we have data and want to train a model of a set of data points $\{x_1 \dots x_N\}$?

Networks trains to project **x** to fit the hyphersphere center **c**

[Ruff(2019)]

- + Trains the network "discriminatively",
- One has to be careful with trivial solutions
 - i. e. $\mathbf{c} \neq 0$, no biases and unbounded non-linearity

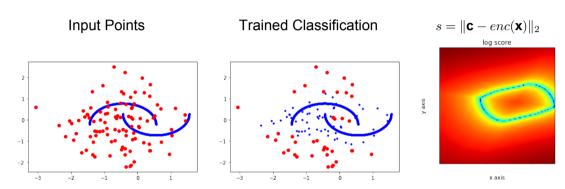

Anomaly Detection - One Class Loss

```
enc = nn.Sequential(nn.Linear(2,8, bias = False),
    nn.Linear(8.16. bias = False).
    nn.Linear(16,4, bias = False))
# random center of 4D hypersphere
c = torch.randn((1,4), requires grad = False)
optimizer = optim.Adam(enc.parameters())
# reconstruction (X hat)
X hat = enc(X)
loss = vector norm(X hat - c, dim = -1).mean()
# Optimisation enc s.t. min //c - enc(X hat)// 2
optimizer.zero grad()
loss.backward()
optimizer.step()
```

See https://github.com/sulcantonin/MLE-2022/blob/main/MLE_OCL.ipynb

Anomaly Detection - One Class Loss Example Cont'd

See https://github.com/sulcantonin/MLE-2022/blob/main/MLE_OCL.ipynb

Anomaly Detection - Semi-Supervised

What if we have data and want to train a model of a set of data points $\{x_1, \dots, x_N\}$ with very few **known** anomalies?

$$\mathbf{x} \qquad \mathbf{z} = enc(\mathbf{x})$$

$$s = \|enc(\mathbf{x}) - \mathbf{c}\|_2$$

$$= \|\mathbf{z} - \mathbf{c}\|_2$$

$$s = \|enc(\mathbf{x}) - \mathbf{c}\|_2$$
 Bottleneck
$$s = \|enc(\mathbf{x}) - \mathbf{c}\|^l$$
 where $l \in \{-1, 1\}$

See https://github.com/sulcantonin/MLE-2022/blob/main/MLE SAD.ipynb

Known anomalies (l = -1) encourage enc and **c** to move away.

Anomaly $\rightarrow \|enc(\mathbf{x}) - \mathbf{c}\|^{-1}$

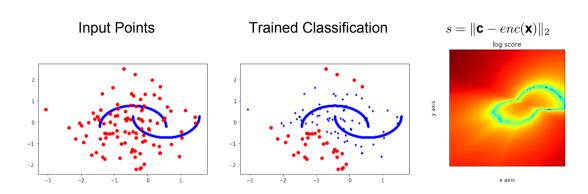

Anomaly Detection - Semi-Supervised Example

```
enc = nn.Sequential(nn.Linear(2,8),
    nn.Linear(8.16).
    nn.Linear(16,4))
# random center of 4D hypersphere
enc.c = nn.Parameter(torch.randn((1,4), requires_grad = True))
optimizer = optim.Adam(enc.parameters())
# reconstruction (X_hat)
X hat = enc(X)
loss = vector norm((X hat -c)**1, dim = -1).mean()
# Optimisation enc s.t. min //c - enc(X hat)// 2
optimizer.zero grad()
loss.backward()
optimizer.step()
```

See https://github.com/sulcantonin/MLE-2022/blob/main/MLE_SAD.ipynb

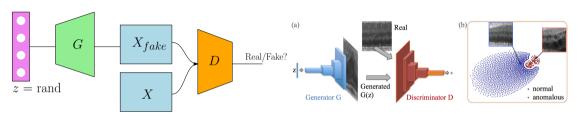

Anomaly Detection - Semi-supervised Example Cont'd

See https://github.com/sulcantonin/MLE-2022/blob/main/MLE_SAD.ipynb

Anomaly Detection - Generative Adversarial Networks

- G generates fake samples and tries to fool discriminator D.
- > D receives fake and real samples and tries to distinguish if an input is fake or real.

[Goodfellow et al.(2020)Goodfellow, Pouget-Abadie, Mirza, Xu, Warde-Farley, Ozair, Courville, and Bengio, Wiggers(2019),

Schlegl et al.(2017)Schlegl, Seeböck, Waldstein, Schmidt-Erfurth, and Langs]

$$\arg\min_{z_{\gamma}}\{(1-\lambda)\|x-G\left(z_{\gamma}\right)\|+\lambda CrossEntropyLoss\left(D\left(G\left(z_{\gamma}\right)\right),1\right)\}$$

See https://github.com/sulcantonin/MLE-2022/blob/main/MLE_GAN.ipynb

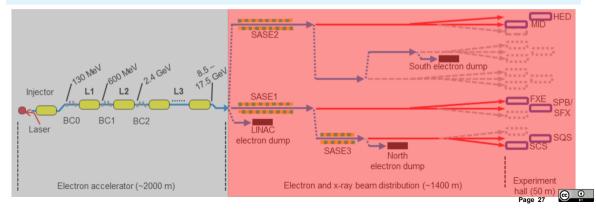

Anomaly Detection at European XFEL

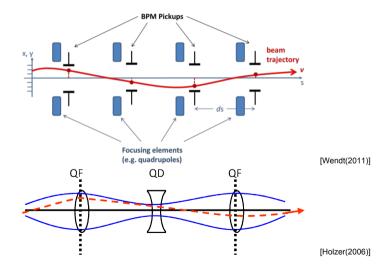

Orbit Monitoring

Assumption

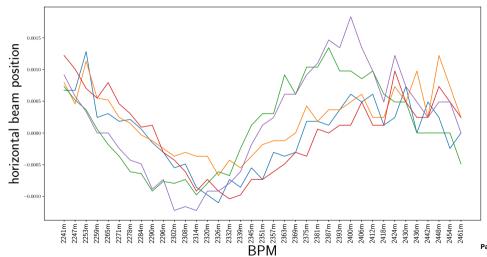

There is a systematic pattern shown in orbits given by the physical construction of EuXFEL.

Orbit Monitoring - FODO Lattice

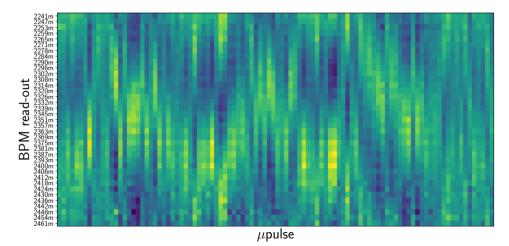

Orbit Monitoring

Orbit Monitoring

Orbit Monitoring

```
\hat{\mathbf{X}} \longrightarrow \mathbf{h}_1 = \text{GRU}_1(\hat{\mathbf{D}}) \qquad \qquad \phi = \text{Linear}(\mathbf{h}_2) \qquad \qquad \mathbf{s} = \|\phi - \mathbf{c}\|_2 
input=16, output=16

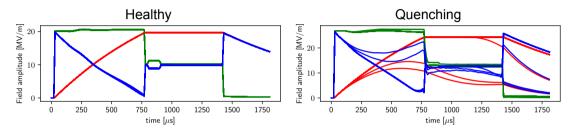

features f_{\theta}(\hat{\mathbf{X}})

\text{rnn} = \text{nn.GRU}(64, 16)
\text{lin} = \text{nn.Linear}(16, 16)
\text{c} = \text{nn.randn}((16))
\text{s} = \text{vector\_rnom}(\text{c} - \text{lin}(\text{rnn}(\text{x})[0], \text{dim} = -1)
```

See https://github.com/sulcantonin/MLE-2022/blob/main/MLE_orbit.ipynb

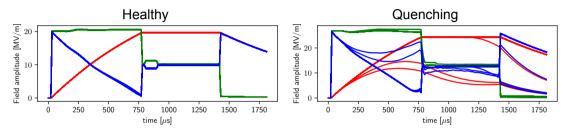

Monitoring Superconducting LLRF Cavities

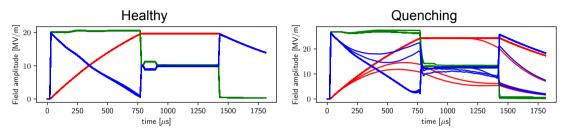

We record an envelope (phase, amplitude) of three signals - probe, forward and reflected signals.

Monitoring Superconducting LLRF Cavities

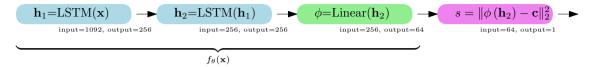

- We record an envelope (phase, amplitude) of three signals probe, forward and reflected signals.
- > Each signal consists of a pair of 1820 values (amplitude, phase) per pulse.

Monitoring Superconducting LLRF Cavities

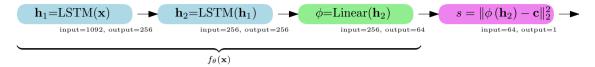

- We record an envelope (phase, amplitude) of three signals probe, forward and reflected signals.
- > Each signal consists of a pair of 1820 values (amplitude, phase) per pulse.
- > Quench (right) means a loss of superconductivity in a cavity, which has a significant effect on the quality factor.

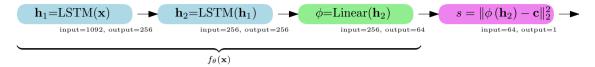

A RNN is assigning a score to series of cavity pulses.

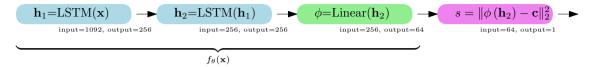

- > A RNN is assigning a score to series of cavity pulses.
- > Each datum x (pulse) consist of (probe, forward and reflected signals).

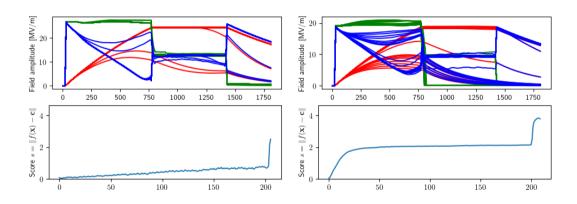

- > A RNN is assigning a score to series of cavity pulses.
- > Each datum **x** (pulse) consist of (probe, forward and reflected signals).
- We have a disproportionately smaller dataset with faults (1300 faults) and (almost) unlimited access to healthy data.

- > A RNN is assigning a score to series of cavity pulses.
- > Each datum **x** (pulse) consist of (probe, forward and reflected signals).
- We have a disproportionately smaller dataset with faults (1300 faults) and (almost) unlimited access to healthy data.
- > Semi-supervised anomaly loss [Ruff(2019)]

$$L(\theta) = \|f_{\theta}(\mathbf{x}) - \mathbf{c}\|_{2}^{y} + \|f_{\theta}(\mathbf{x}) - \mathbf{c}\|_{2} \text{ where } y \in \{-1, 1\}.$$

Results - Quenches
